Accountabilities for PCR, LCA and independent, third-party verification

Product Category Rules (PCR)

CEN standard EN 15804 serves as the Core Product Category Rules (PCR)

Product Category Rules (PCR): Construction products and construction services. Version 1.1.

PCR review was conducted by: PCR Committee: IVL Swedish Environmental Research Institute, Swedish Environmental Protection Agency, SP Trä, Swedish Wood Preservation Institute, Swedisol, SCDA, Svenskt Limträ AB, SSAB

Moderator: Martin Erlandsson, IVL Swedish Environmental Research Institute.

Life Cycle Assessment (LCA)

LCA accountability: Carla Coelho & Sofia Lindroth, Miljögiraff AB

Third-party verification

Independent third-party verification of the declaration and data, according to ISO 14025:2006, via:

 \boxtimes EPD verification by individual verifier

Third-party verifier: Martyna Mikusinska, Sweco

Approved by: The International EPD® System

Procedure for follow-up of data during EPD validity involves third party verifier:

□ Yes 🛛 🖾 No

The EPD owner has the sole ownership, liability, and responsibility for the EPD.

EPDs within the same product category but from different programs may not be comparable. EPDs of construction products may not be comparable if they do not comply with EN 15804. For further information about comparability, see EN 15804 and ISO 14025.

Company information

<u>Owner of the EPD:</u> Lyssand-Frekhaug AS, Ulsmågveien 7, 5224 Nesttun <u>Contact:</u> Christian Tollefsen

<u>Description of the organisation:</u> Lyssand AB, is one the largest window manufacturers in Norway, the windows are sold nation-wide and are made for the demanding climate of the long Norwegian coastline. Lyssand has produced windows since 1947 and is part of the Inwido group.

Average or specific EPD: Average

This EPD is averaged for the production in regard to the production sites. Production is done by Elitfönster which are part of the same group as Lyssand, the Inwido group. Production is taking place in both Vetlanda and Lenhovda. An average weighted number is presented in the results table based on the production volume from the different sites. This difference is within +/-10%, for all impact categories.

Product information

An outward opening wooden top-swing window with a 3-glazed insulating glass. The frame of the window opens outwards and can be turned around 180 degrees outside the facade thanks to the special top-swing hardware, which is practical when the glass is to be cleaned on the outside. The finished window weighs 37.82 kg per m².

According to the Construction Products Regulation CPR (EU) no. 305/2011, the essential properties of products must be declared in the CE marking and Declaration of Performance. The technical properties of the window are reported in the following Declaration of performance, which can be accessed on Elitfönster's website or by scanning the QR code on the product. DoP nr 61-29-CE1010101

Insulating glass:

The glass consists of a float glass that is coated with a thin film of metal oxide that lets through shortwave solar energy and reflects long-wave room heat. The coating is almost completely transparent, but there is some difference in light input between coated glass and uncoated glass. Coated glass is used to achieve better insulating performance.

An insulating glass consists of glasses that are separated from each other by spacers, these spaces can be filled with argon to give the insulating glass a better insulating ability. Argon does not affect sunlight radiation but improves the insulating ability of the insulating glass.

This EPD regards:

Lyssand 105 is a 3-layer window with high insulating capacity on a105 mm deep frame. The three glasses are separated by two spacers made of plastic (hot edge). The inner and outer glass are coated and both glass spaces are filled with argon.

LCA information

The weight of the finished window is 37.82 kg per m ³ . Standard size for TS is 1230 x 1480mm Reference Service Life RSL) The RSL is set to 40 years. For the windows expected life length to be realised, it is paramount that instructions for assembly and care provided by the manufacturer are followed. Product group UN CPC 42120 Soal and Scope The result will be used to understand where the environmental burden for the product occurs during the life cycle and aim to lay a road map for development to reduce this burden. The result will be communicated by the International EPD system. All site-specific data refers to the period between 2019 and 2022. Scope is cradle-to-grave and module D. instructions norn Lyssand.		instructions from Lyssand.

	FP	R

	 The product is assumed to require 10 ml/m² of soap, 200 ml/m² of cleaning solution, 10 liters/m² and 5 ml/m² of lubrication oil per year. The used window is assumed to be transported 75km to the closest waste management facility. There it is disassembled, and the following waste treatment activities performed: Aluminium and steel are recycled with a spillage of 3%. Glass is landfilled at 100% landfilling rate Wood, paint, plastic, rubber and misc. is assumed to be incinerated with energy recovery at a municipal incineration plant at 90% efficiency rate.
	Waste not recycled or incinerated is assumed to go to landfill.
Allocations	As the manufacturing site produces different products, allocation of energy and
	inputs required in the fabrication of the product was based on its manufacturing complexity. Therefore a simple product would be allocated less resources than a
	more complex product.
Impact Assessment	Potential environmental impacts are calculated with Environmental Footprint 3.0
methods	method as implemented in SimaPro 9.4.0.2. Resource use values are calculated
	from Cumulative Energy Demand
	V1.11.
Based on LCA Report	Life Cycle Assessment of Windows from Lyssand, Miljögiraff report 1121
LCA Practitioner	Carla Coelho & Sofia Lindroth, Miljögiraff AB
Software	SimaPro 9.4.0.2

System diagram:

More information:

Lyssand is part of Inwido Group with among others Elitfönster, which do the production of the windows for Lyssand. Elitfönster has its production in Sweden with the following manufacturing procedure:

The wood raw material used is pine supplied by FSC-labelled and / or PEFC-labelled suppliers that glues and finger joins the wood raw material. The wood is cut and planed and processed at the production site in Vetlanda, the finished wood details are surface treated with a water-based paint system. Elitfönster's own glass factory, IGF in Lenhovda, uses flat glass from Europe's largest glass manufacturer. IGF cuts the glass and manufactures the insulating glass. The glass is installed in the product in the manufacturing unit in Vetlanda. Aluminium profiles are delivered by Hydro in Vetlanda, they are processed and powder coated on A-paint in Sävsjö, then transported to the manufacturing unit in Vetlanda or Lenhovda for final assembly. The finished windows are packed on a wooden pallet with plywood slats and cardboard corners and plasticised with shrink plastic. The windows are transported on pallets by truck to the customer.

To produce 1 m² product, 16,6 kWh of electricity is used as well as 11,8 kWh of heat from own combustion of wood waste created during production and 0,034 kg biogas. Electricity is certified wind power electricity. In total, around 20% of the total incoming raw materials becomes production waste. A large part of the waste is wood.

During usage, no indoor emissions arise. The paint used is water based and all the other raw materials do not cause any emissions.

Information on biogenic carbon content

Results per functional or declared unit				
BIOGENIC CARBON CONTENT	Unit	QUANTITY		
Biogenic carbon content in product	kg C	7,2		
Biogenic carbon content in packaging	kg C	0,9		

Note: 1 kg biogenic carbon is equivalent to 44/12 kg CO₂.

Additional information

Harmonisation with EPD Norway

This scenario for module A4 is added for the harmonisation of EPD International and EPD Norway. The requirement of the Norwegian EPD Foundation (Nordic MRA) for the mutual recognition of product category rules (PCRs) and environmental product declarations (EPDs) of all product categories is that a declaration of additional scenario information and LCA results for module A4-transport from production site to central warehouse in Oslo must be assessed. The results for the A4 module being transported from the production site to Oslo are presented in tables below. A transport scenario was assessed for transport from Lenhovda to Oslo (527 km) instead of to Rolvsøy (447 km), using a truck EURO6.

ANNEX 1

ANNEX 1: Self declaration from EPD owner Specific requirements

1 Applied electricity data set used in the manufacturing phase

The electricity mix for the electricity used in manufacturing (A3) is the electricity grid mix:

100% wind power certified by guarantee of origin, i.e. A3 footprint is 1,20E+01 kg CO2/ FU for S-P-08016. The windpower footprint is calculated using ecoinvent data, so it is treated as background data and we did not use any specific emissions factor of kg CO2/MJ. The following electricity dataset from ecoinvent 3,8 was used:

Electricity, high voltage {SE} | electricity production, wind, >3MW turbine, onshore | Cut-off, U

I believe this should provide sufficient transparency allowing full reproducability that is required in an EPD documentation. The other energy sources are presented in table 13 of the LCA report, which presents the weighted consumption values.

2 Transport from the place of manufacture to a central warehouse

Transport distance, and CO_2 -eqv./DU from transport of the product from factory gate to central warehouse in Oslo shall be given. The following table shall be included in the EPD:

See table 1 on page 12 of each individual EPD for specific data for each product.

3 Impact on the indoor environment

- Indoor air emission testing has been performed; specify test method and reference;
 M1, ______
- □ No test has being performed
- □ Not relevant; During usage, no indoor emissions arise. The paint used is water based and all the other raw materials do not emit any emissions.
