

Environmental Product Declaration

In accordance with ISO14025:2006 and EN15804:2012+A2:2019

Methylcellulose

Owner of the declaration:

SE Tylose GmbH & Co. KG

Product name: Methylcellulose

Declared unit: 1 kg Methylcellulose

Product category /PCR: Basic Chemicals 2021:03 v.1.1.1

Program holder and publisher:

The Norwegian EPD foundation

Declaration number: NEPD-5642-4909-EN

Registration number: NEPD-5642-4909-EN

Issue date: 03.01.2024

Valid to: 03.01.2029

The Norwegian EPD Foundation

General information

Product:

Methylcellulose

Program operator:

The Norwegian EPD Foundation

Post Box 5250 Majorstuen, 0303 Oslo, Norway

Phone: +47 23 08 80 00 e-mail: post@epd-norge.no

Declaration number:

NEPD-5642-4909-EN

This declaration is based on Product Category Rules:

Basic Chemicals 2021:03 v.1.1.1

Statement of liability:

The owner of the declaration shall be liable for the underlying information and evidence. EPD Norway shall not be liable with respect to manufacturer, life cycle assessment data and evidences.

Declared unit:

1 kg Methylcellulose

Declared unit with option:

A1-A3, A4, A5, C1, C2, C3, C4, D

Functional unit:

-

Verification:

Independent verification of the declaration and data, according to ISO14025:2010

internal external X

Elisabet Amat, GREENIZE Independent verifier approved by EPD Norway

Owner of the declaration:

SE Tylose GmbH & Co. KG

Contact person: Mike Kleinert Phone: +49 611 962 6654

Manufacturer:

SE Tylose GmbH & Co. KG

Kasteler Str. 45, 65203 Wiesbaden, Germany

Phone: +49 611 962 04 e-mail: info@setylose.com

Place of production:

Wiesbaden, Germany

Management system:

ISO 9001, ISO 14001, ISO 45001, ISO 50001

Organisation no:

HRB 21112

Issue date:

03.01.2024

Valid to:

03.01.2029

Year of study:

2022

Comparability:

EPD of products may not be able to compare if they do not comply with EN 15804. EPDs from other programs than The Norwegian EPD Foundation may not be comparable.

The EPD has been worked out by:

Product

Product description:

Methylcellulose (MC) can be seen as a generic term for natural cellulose which has been modified by etherification. Common to these MCs is the methylation. Additionally, to such pure MC [9004-64-5], a binary etherification can be conducted either with ethylene oxide (to yield Hydroxyethylmethylcellulose, HEMC [9032-42-2]) or propylene oxide (Hydroxypropylmethylcellulose, HPMC [9004-65-3]). Throughout this document all such type MCs have been assessed collectively and the results are applicable for all MCs, consequently.

MC are nonionic cellulose ethers, which are offered as free flowing powder or in granular form and are soluble in water. Depending on the desired viscosity of the final product in aqueous solution, cellulose from either cotton linters or from wood pulp is used. The utilised wood pulp is exclusively from manufacturers who are certified according to sustainable management of the PEFC (Programme for the Endorsement of Forest Certification Schemes).

Product specification:

Methylcellulose (MC) typically has a dry matter content of 95% or more when sold to the customer. Also, depending on the application, a residual salt content (NaCl) of less than 1% remains in the product. Consequently, the product consists of Methylcellulose, water and maximum 1% salt.

The type and the amount of product packaging depends on the specific customer requirements. The results are based on a representative mix of packaging materials per sold product per year. The packaging amounts to 0.035 kg per kg of product.

Materials	g	%
Methylcellulose	940	94
Water	50	5
Sodium chloride	10	1
Packaging	35.49	-

Technical data:

The dry matter content of the product is 95%.

Market:

Global

Reference service life, product:

LCA: Calculation rules

Declared unit:

The declared unit is 1 kg of Methylcellulose (dry matter content 94 %). Packaging burdens are declared separately.

Cut-off criteria:

All available data was considered in the LCA and no materials were cut-off.

Allocation:

No allocation applied in this study.

Data quality:

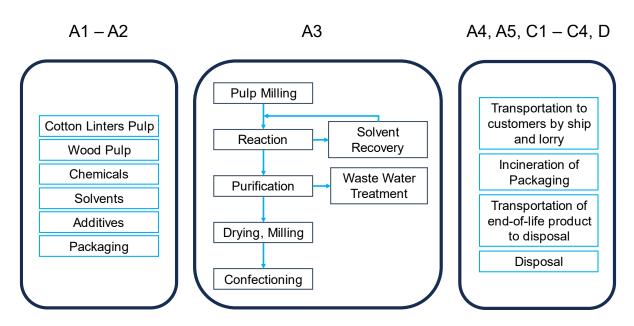

The performed LCA complies with the data quality requirements described in PCR 2021:03 Basic Chemicals v1.1.1. Specific data was implemented wherever possible. If not available, generic data from the ecoinvent database was used and missing data was modelled with literature data. Proxies were only used for materials with a very low mass contribution. In total, only 1.13 wt.% of the input (material only, i.e., excluding energy and media like steam, nitrogen etc.) for MC production are proxies. Data on consumption of natural resources, energy carriers, chemicals, emissions, upstream and downstream transport modes are site specific from SE Tylose. Foreground data refers to the year 2022 and to the production site of SE Tylose in Wiesbaden, Germany. As far as possible, the supply of materials in the countries of origin as specified by SE Tylose, including corresponding transport processes to the next processing step, was considered. Thus, data from the area under study (DE) was used. If not available, data from a larger area than the area under study was included, e.g., Europe (RER) or Global (GLO), the latter representing activities that are considered as average and valid for all the countries in the world. To ensure temporal relevance, the newest currently available ecoinvent database 3.9.1 from 2023 was used. Supplier specific data is not older than the year 2019.

System boundaries (X=included, MND=module not declared, MNR=module not relevant)

U	p- eam	Core		Downstream												Benefits & loads
Pro	oduct s	tage		mbly ige		Use stage End of life stage						beyond system bound- ary				
Raw materials	Transport	Manufacturing	Transport	Assembly	Use	Maintenance	Repair	Replacement	Refurbishment	Operational energy use	Operational water use	De-construction demolition	Transport	Waste processing	Disposal	Reuse-Recovery-Recycling- potential
A1	A2	А3	A4	A5	B1	B2	В3	B4	В5	В6	В7	C1	C2	C3	C4	D
X	X	X	X	X	MND	MND	MND	MND	MND	MND	MND	X	X	X	X	X

System boundary:

The system boundary is defined as cradle-to-gate with options and includes stages A1 – A5 as well as end-of-life stages C1 – C4 and D as illustrated by the flowchart.

All processes from raw material sourcing (pulps, all utilized chemicals and additives as well as the diverse packaging solutions), transport to the production site in Wiesbaden, the chemical manufacturing including all side-processes connected until the final transport stage of the product to the worldwide customer sites and the end-of-life stage are evaluated and included. The usephase was excluded from the analysis, because MC is used in a variety of products from different industry sectors like food, pharma, cosmetics and building/construction. Due to this multifunctionality, different scenarios take place at the end-of-life stage of MC. Since a share of MC is incorporated in building materials, the demolition phase of MC products takes place with the whole demolition of the building/construction and should rather be allocated to the final building material (e.g. gypsum, cement etc.). Therefore, the module C1 is set to zero. For module C2 a generic transportation mode of 50 km from demolition to the disposal site was assumed. Products that incorporate MC may be processed for recycling (e.g. cement, gypsum or other building materials). However, MC itself is fully incorporated into these systems and cannot be seperated from other materials inside the product. Hence, waste treatment efforts should not be allocated to MC, but rather to the final product. Therefore, C3 was set to zero and information regarding module C3 should be taken from EPDs of the materials that incorporate MC. For the final disposal, two scenarios were included. All material that is enclosed in building products like cement, paint or other building material will be landfilled at end-of-life as inert material (ecoinvent dataset). MC, that is used in ceramics is typically burned directly in sinter-ovens. The other share, that is used in food, pharma and cosmetics will go to wastewater and will ultimately be decomposed to CO₂. The modelling of combustion and decomposition is done by calculating biogenic carbon share to CO₂ (biogenic C*44/12) and fossil carbon share to fossil CO₂ (fossil C*44/12).

LCA: Scenarios and additional technical information

The following information describe the scenarios in the different modules of the EPD.

Transport from production place to assembly/user (A4)

Transport from production place to assembly/user (A4)	Capacity utilisa- tion (incl. return) %	Туре	Dis- tance (km)	Fuel/Energy con- sumption	Unit	Value [kg fuel/kg]
Truck	72	market for transport, freight, lorry, un- specified, Cutoff, S - RER	1067	3.11E-02	kg/t*km	3.31E-02
Boat	100	transport, freight, sea, con- tainer ship; Cut- off, S - GLO	9791	2.52E-03	kg/t*km	2.46E-02

For the transport processes, average data from ecoinvent 3.9.1 is used and the same average capacity load is assumed here.

Assembly (A5)

	Unit	Value
Waste treatment of packaging	kg	0.035

In total, 0.035 kg of packaging per t MC is necessary. It is assumed that all packaging material is incinerated.

End of Life (C1, C3, C4)

	Unit	Value
To landfill	kg	0.81
Incinerated / decomposed	kg	0.19

Landfilled material is modelled with ecoinvent dataset for inert material landfill.

The biogenic and fossil carbon content of the product at factory gate has been used to calculate the emissions of CO_2 from end-of-life (C4) for the share that is incinerated or decomposed (e.g., in wastewater treatment). As declared in the EN 15804 standard, all biogenic carbon must be released to biogenic CO_2 at the end-of-life, because the biogenic CO_2 must be balanced to zero throughout the complete life cycle of a product (i.e., biogenic CO_2 uptake from atmosphere = biogenic CO_2 release at end-of-life). The fossil carbon content of MC however is only converted to CO_2 for the share that is not landfilled. 1 kg of carbon corresponds to 44/12 kg CO_2 emissions.

Transport to waste processing (C2)

Transport from production place to assembly/user (C2)	Capacity utilisa- tion (incl. return) %	Туре	Distance (km)	Diesel con- sumption	Unit	Value [kg fuel/kg]
Truck	72	market for transport, freight, lorry, unspecified, Cutoff, S - RER	50	3.11E-02	kg/t*km	1.55E-03

Benefits and loads beyond the system boundaries (D)

MC is used in a variety of products from different industry sectors like food, pharma, cosmetics, and building/construction and is always incorporated into these products. Recycling of certain building materials that incorporate MC is possible (e.g., gypsum, cement etc.) but these recycling potentials should be allocated to the final products. Furthermore, energy recovery from incineration of MC itself or from incineration of methane as a byproduct from wastewater treatment processes of MC-containing materials (e.g., from food or cosmetic industry) is possible, but is neglected here due to high uncertainties, such as loss rates and efficiencies. Therefore, module D is set to 0.

LCA: Results

The supply of raw materials (A1 – A2) dominates the environmental footprint for most impact categories by approx. 9% up to 99%, depending on the impact category, followed by energy and media related consumptions (A3), which contribute by approx. 1 – 39%. Infrastructure is also implemented, which is reflected in abiotic resource consumption (ADP-M&M) by approx. 23%. However, the data applied as well as the results need to be treated carefully, especially as no specific plant information and lifetimes were available. In the first instance and to get a first hint of the environmental impact of the plant, the ecoinvent data set / process "chemical factory, organics" was used, which includes land use, buildings, and facilities (including dismantling) of an average chemical plant. Downstream transportation to customers (A4) contributes by 0% – 14%. The end-of-life phase (C1 – C4) has a minor impact below 2% for most categories.

¹ This impact category deals mainly with the eventual impact of low dose ionizing radiation on human health of the nuclear fuel cycle. It does not consider effects due to possible nuclear accidents, occupational exposure nor due to radioactive waste disposal in underground facilities. Potential ionizing radiation from the soil, from radon and from some construction materials is also not measured by this indicator.

² The results of this environmental impact indicator shall be used with care as the uncertainties on these results are high or as there is limited experienced with the indicator

CR Components for reuse; MR Materials for recycling; MER Materials for energy recovery; EEE Exported electric energy; ETE Exported thermal energy.

All processes are included within the system boundaries of MC and packaging production.

Information describing the biogenic carbon content at the factory gate

Biogenic carbon content	Unit	Value
Biogenic carbon content in product	kg C/kg MC	0.445
Biogenic carbon content in the accompanying packaging	kg C/kg Packaging	0.355

On a mass basis, the biogenic carbon content in the untreated source material, i.e., cellulose obtained from renewable resources (either wood or cotton linters) amounts to 44.45 wt.%. This is 100% of all carbon in natural cellulose and can either be measured by ultimate analysis or derived from the chemical formula. The etherification towards Methylcellulose is currently conducted with materials from fossil resources. Hence, the degree of etherification determines the quantity of added non-biogenic carbon. The degree of etherification is pre-determined by the specific product property requirements. For MC, the overall carbon content (biogenic + fossil) amounts to 50.48 wt.% carbon. Consequently, as the biogenic fraction is 44.45% carbon, the biogenic carbon equals 88.1% of the product's carbon in Methylcellulose.

11

Additional requirements

Location based electricity mix from the use of electricity in manufacturing

National electricity grid	Data source	value	unit
electricity, high voltage, heat and power co-generation, natural gas, conventional power plant, 100MW electrical, electricity, high voltage, Cutoff, S – DE	Ecoinvent 3.9.1	0.374	kg CO2-eq/kWh

The electricity is supplied by the on-site energy supplier InfraServ GmbH & Co. Wiesbaden KG. InfraServ was able to supply externally verified carbon footprint data for electricity. Since a carbon footprint does not give any information on other impact categories than global warming potential, the equivalent ecoinvent dataset «electricity, high voltage, heat and power co-generation, natural gas, conventional power plant, 100MW electrical, electricity, high voltage, Cutoff, S – DE» was used and adjusted with the elementary flow «carbon dioxide, fossil» as output to yield the supplier specific carbon footprint in the LCA model.

Additional environmental impact indicators required for construction products

In order to increase the transparency of biogenic carbon contribution to climate impact, the indicator GWP-IOBC is required as it declares climate impacts calculated according to the principle of instantaneous oxidation. GWP-IOBC is also referred to as GWP-GHG in context to Swedish public procurement legislation.

Additional environmental impact indicators for 1 kg of MC

	Upstream Core		ore Downstream										
Parameter	Unit	A1	A2	A3 (product)	A3 (packaging)	A4	A5 (product)	A5 (packaging)	C1	C2	С3	C4	D
GWP-IOBC	kg CO2 eq.	2.64E+00	9.04E-02	1.93E+00	4.21E-02	2.58E-01	0.00E+00	2.18E-02	0.00E+00	7.43E-03	0.00E+00	4.73E-02	0.00E+00

GWP-IOBC Global warming potential calculated according to the principle of instantaneous oxidation.

Additional information for end-of-life scenario of 1 kg MC

As stated above, 81 % of sold MC materials are incorporated into products, which will ultimately go to landfill at end-of-life. These materials can be seen as a carbon sink, as CO₂ from atmosphere is stored in these materials. Credits for carbon storage must not be declared in EPDs according to standard EN 15804. However, taking the carbon storage into account decreases the GWP-total of MC over its whole life cycle by 33 %.

Hazardous substances

The declaration is based upon reference to threshold values and/or test results and/or material safety data sheets provided to EPD verifiers. Documentation available upon request to EPD owner.

	X	The product contains	no substances	given by the	REACH	Candidate 1	list.
--	---	----------------------	---------------	--------------	-------	-------------	-------

- ☐ The product contains substances given by the REACH Candidate list that are less than 0,1 % by weight.
- $\ \square$ The product contains dangerous substances, more then 0,1% by weight, given by the REACH Candidate List, see table.
- ☐ The product contains no substances given by the REACH Candidate list.
- $\ \square$ The product is classified as hazardous waste, see table.

Indoor environment

No tests have been carried out on the product concerning indoor environment.

Carbon Footprint

Product carbon footprint (PCF) has not been worked out and verified for the product according to ISO 14067.
